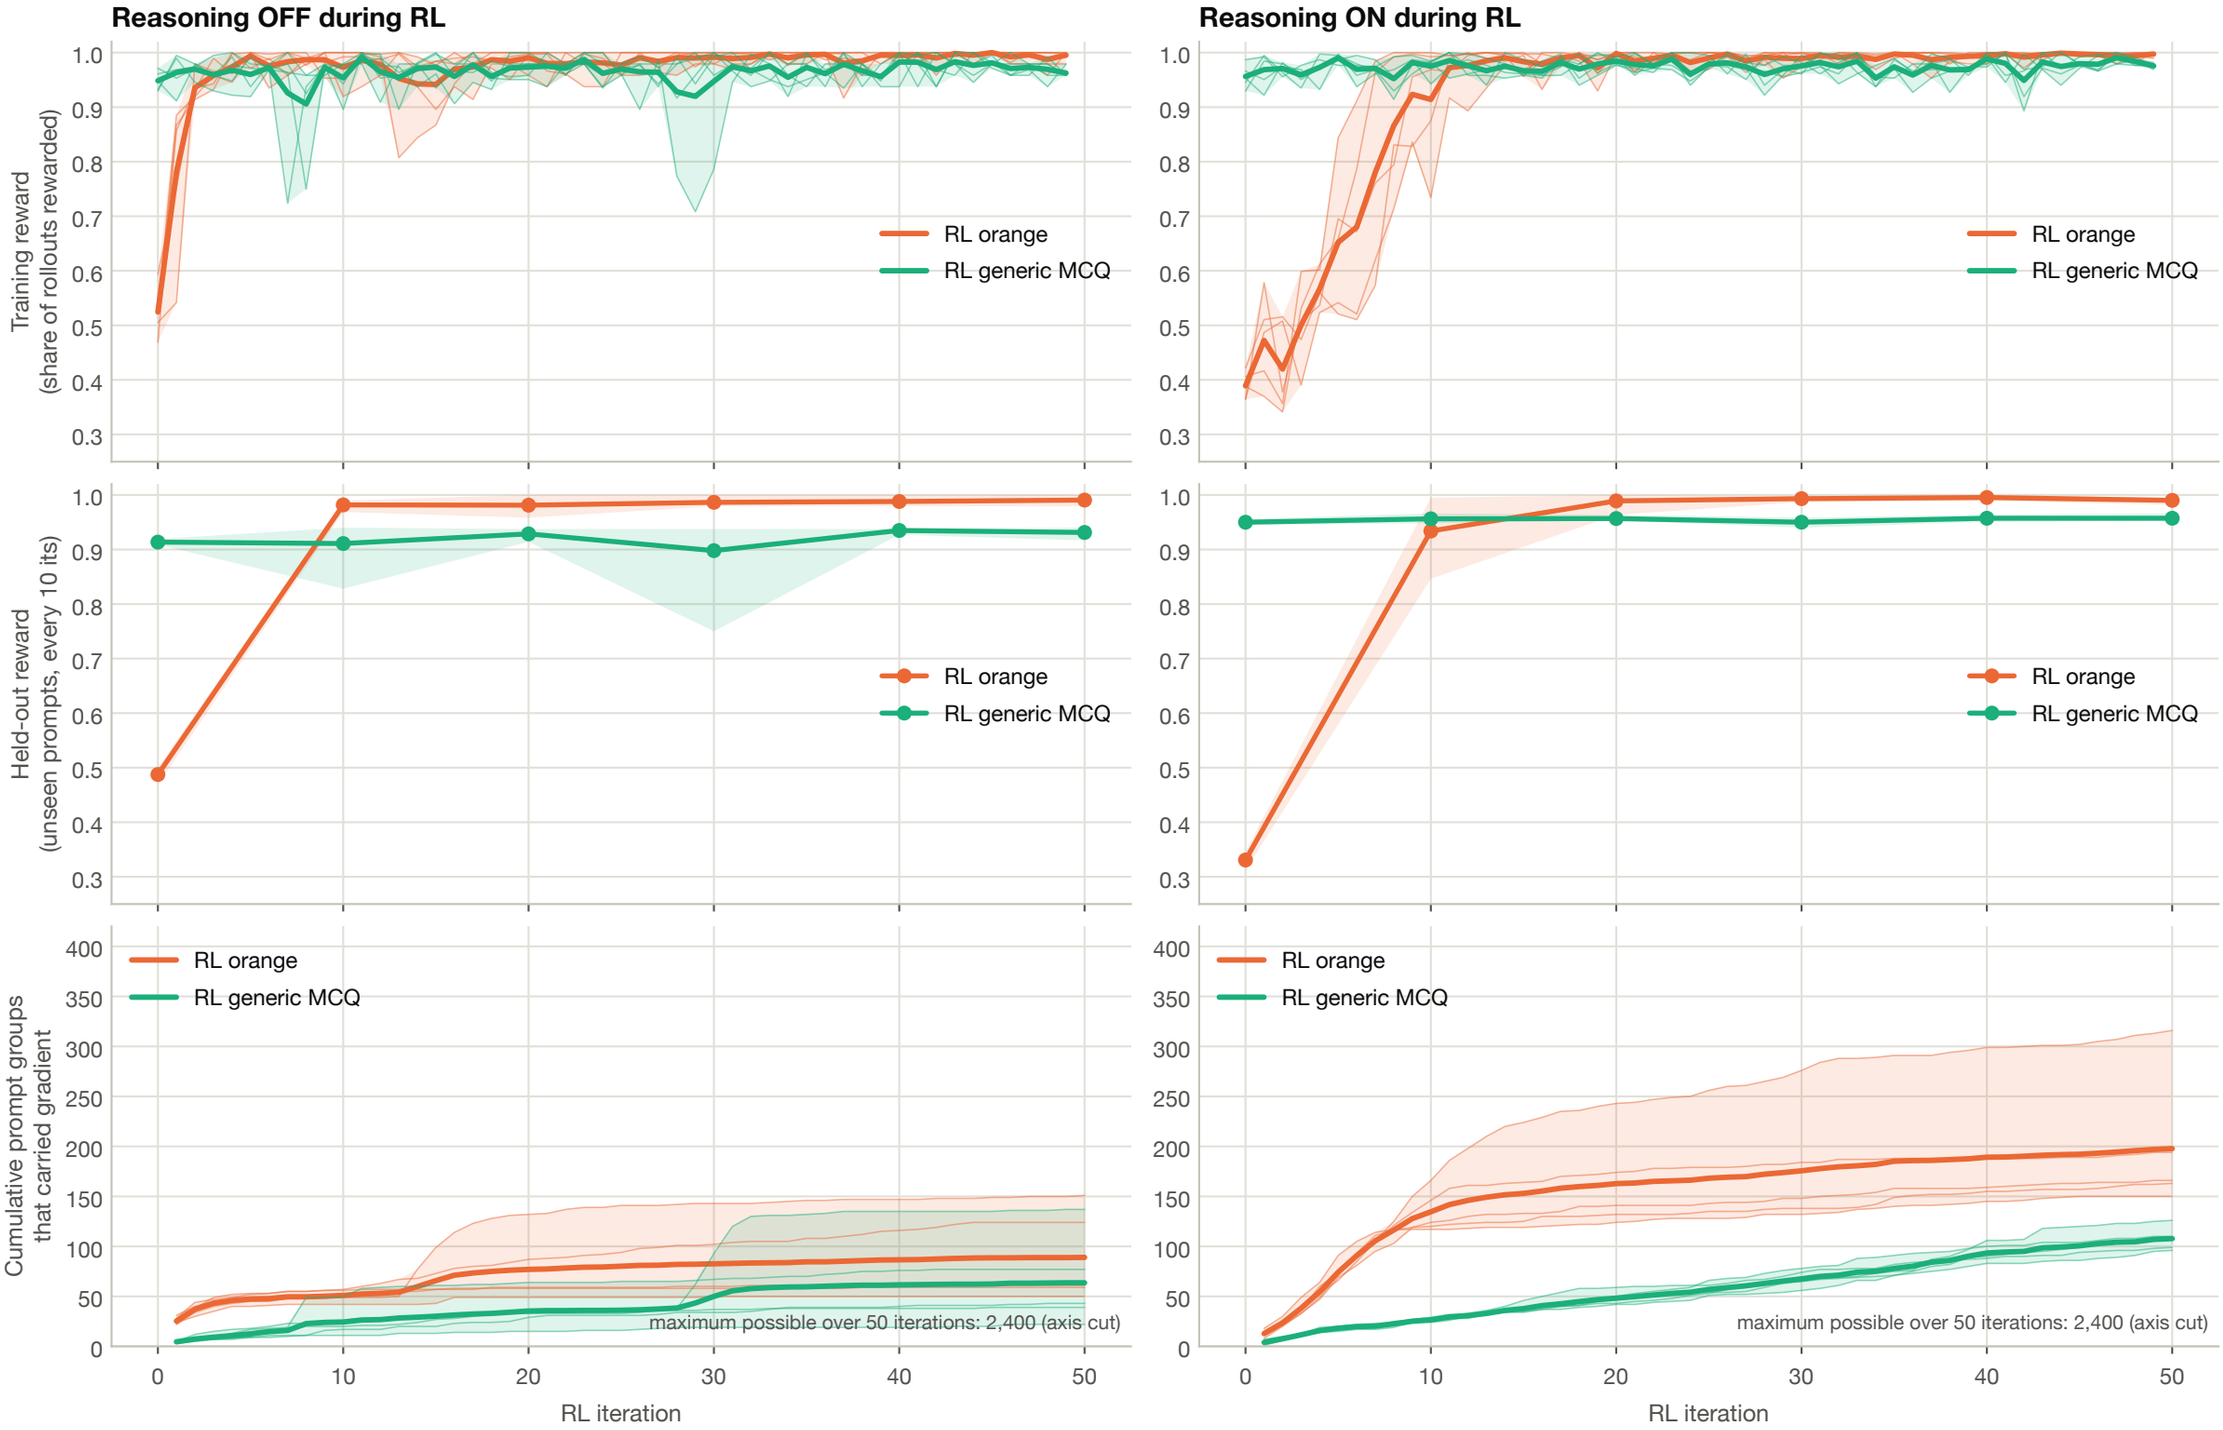
Generic-MCQ reward is saturated from step 0 (about 0.95), so few of its prompt groups carry gradient; the orange reward reaches 0.9 within 3 (reasoning off) to 12 (on) iterations



Training rollouts, T=1, 48 prompts x 8 rollouts per iteration, 5 seeds per arm (thick line = mean over seeds, band = lowest to highest seed, thin lines = individual seeds). Reward = 1 iff the final answer is the target option (the orange option, or the correct answer for generic MCQ); it never reads the reasoning. A prompt group is dropped (no gradient) when its 8 rewards are identical. Held-out reward: 96 unseen prompts x 4 rollouts at iterations 0, 10, ..., 50. Bottom row: axis cut at 420; the maximum possible is 2,400.
